

## Lesson 2 Assignment

Take the program from the lesson and modify it to perform some additional output. If you'd like to keep the projects separate, start by using the **Save As** option in the project window's Project menu to save the complete project to a new directory. Then you can modify the copy without losing the original.

Try experimenting with the output using the `System.out.print()` method as well as the `System.out.println()` method that was in the lesson's example. See if you can figure out the difference in how they work.

Some examples of things you might try include:

- Getting multiple output lines from one statement using Java's newline character ("`\n`")
- Getting multiple output statements to produce one line of output apiece
- Getting multiple strings to print on one line using a combination of `System.out.print()` and `System.out.println()`

If you want to see how I completed these tasks, please click the link below—but not till you've done your own modifications.
