Lesson 10 Quiz

Your grade is determined by your last attempt.

1. What argument or arguments does the printf() method require?

    A. A format string optionally followed by data arguments.

    B. A floating-point argument.

    C. A formatted image followed by a caption.

    D. A file name argument.

2. How can you identify format specifiers in a format string?

    A. They begin with a dollar sign ($).

    B. They begin with a pound sign (#).

    C. They begin with a percent sign (%).

    D. They begin with a hyphen (−).

3. What's a package in the Java API?

    A. A way to group and organize sets of related classes and interfaces.

    B. A prepackaged set of classes that together make up an application.

    C. A set of methods that classes must implement to use the package.

    D. A class in the API together with all its subclasses.

4. How can you find detailed information about a method that's in the API's method summary?

    A. Scroll in the panel on the left until you find the method you're looking for.

    B. Click on the method's name in the summary.

    C. Use the API's search window.

    D. The method summary already contains all the useful details about the method, so there are no more details to find.

5. In what order does the API present information about a class?

    A. Field, constructor, and method summaries; then field, constructor, and method details.

    B. Method, constructor, and field summaries; then method, constructor, and field details.

    C. Field summary and details, constructor summary and details, and method summary and details.

    D. Constructor, field, and method summaries; then constructor, field, and method details.
