Lesson 9 Assignment

Please build an enumeration for the 12 months of the year. Then, in a program, ask your user for a numeric month (1-12), and use a switch statement to set an enumeration variable to the correct value for that month. Once you've done that, use the enumeration variable to display the proper name for the month. In other words, if the user enters the number 3, your program will display "The month is March." Try to develop your own solution before looking at mine below.

I've provided two solutions. Both are complete BlueJ projects compressed into Zip files. If you download and expand the files, you'll have the projects to look at in BlueJ. If you're not familiar with Zip files, check the FAQs for this lesson for instructions on how to expand them.
